                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CDS
                                                                                                                                                                                                                                                                                                                                                                                          The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest socring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):478-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

hutp://www.nih.go.jp/
iun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the most important initiation codon). If this cannot be identified we choose the most important initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="SCL2.01, hypothetical protein, len: >328 aa;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1. 38640

jun/Gqi-lan/frameplot.pl. CAUTION: We may not have predicted the jun/Gqi-lan/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If cannot be the entire insert of the IMPORTANT: This sequence MAX NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (03-AUG-2000) Streptomyces coelicolor sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CBIO 1SA E-mail: barrell@sanger.ac.uk Cosmids supplied by Prof. David A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

The length in codons is given for each CDS.

The length highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot Program of Blbb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              note "nominal overlap with Streptomyces coelicolor cosmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Streptomyces coelicolor sequencing at The Sanger Centre is funded by the BBSKR and Beowulf Genomics
Details of S. coelicolor sequencing at the Sanger Centre are available on the World Wide Web.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (URL; http://www.sanger.ac.uk/Projects/S_coelicolor/)
CDS are numbered using the following system eg SC7B7.01c. SC (S. coelicolor), 7B7 (cosmid name), .01 (first CDS), c (complementary

correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
carboxypeptidase; D-amino acid oxidase; ddah, dimethylarginine dimethylaminohydrolase; dehydrogenase; efflux protain; endonuclease; enoyi CoA hydratase; IPP isomerase; metallopeptidase; oxidoreductase; racemase; regulator; thiolase; transferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (07-APR-1999) Streptomyces coelicolor sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CBIO 1SA E-mail: barrell@sanger.ac.uk Cosmids supplied by Prof. David A. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

It may be shorter because we only sequence coverlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3 (bases 1 to 37245)

similar to many involved in antibiotic resistance egs.
TR:054381 (EMBL:X79146) from the lincomycin-production
gene cluster of Streptomyces lincolnensis 78-11 (578 aa)
fasta scores: opt: 1624, z-score: 1696.3, E(): 0, (50.3%
identity in 541 aa overlap). Contains two Pfam matches to
entry PP00005 ABC_tran, ABC_transporter, two Prosite
matches to PS00017 ATP/GTP-binding site motif A (P-loop)
and Prosite match to PS00211 ABC transporters family
signature. Also contains a possible coiled-coil region

                                                                                                                                                              The present sequence is a DNA (ATCC 21345) encoding S. griseus Ssgh protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

The present sequence is a DNA (ATCC 23345) encoding S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, runinant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

The present sequence is a DNA (ATCC 21386) encoding S. goldeniensis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, erryme inhibitors, antimigraine agents, herbicides, antiparaslic agents, runniant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a DNA (ATCC 23940) encoding S. netropsis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, eryme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ssgA; liquid culture; filamentous bacteria; secondary metabolite; mycelium; antibiotic, antitumour agent; immunosuppressive agent; hypocholesterolaemic agent; enzyme inhibitor; antimigraine agent; herbicide; antimisarisic agent; ruminant growth promoter; ATCC 23940; bioinsecticide; receptor agent; antagonist; biomass; ds.

The present sequence is a DNA (ATCC 3004) encoding S. albus G SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, entitumour antimigraine agents, hebblicides, antiparaslit agents, runninant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 gtcggcgatccgtatgccatccggatgacgttccaccttcccggcgatgcccttgtgacc 120

                                                                                                                                                                                                                                                                                                                                                                                                        Eberz G,
      This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to identify, inactivate or modulate genes involved in the biosynthesis of (II); (ii) to generate a library of polyketide synthases; (iii) for adding forosamine or trimethylrhamnose to a spinosyn or polyketide carpynes, which are used for recombinant production of the corresponding enzymes, which are used for production of the corresponding enzymes, which are used for production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are also be used to raise specific antibodies, useful for identifying corpusations in a gene bank. Cells transformed with (I) may produce (II) at significantly increased levels or produce new derivatives of expression clones in a gene bank. Cells transformed with (I) may produce (II). This sequence represents a genomic DNA fragment of the S. Spinosa of formation and trianthylly and produce for contains the coding regions for proteins involved in
                                                                                                                                                                                                     New nucleic acid encoding enzymes for spinosyn biosynthesis, useful for recombinant production of insecticidal spinosyns and their derivatives
                                                                                                                        Salas JA;

This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to dentify, inactivate or modulate genes involved in the biosynthesis of [II]; (ii) to generate a library of polyketide synthases; (iii) for adding forosamine or trimethylrhamnose to a spinosyn or polyketide aglycone; and (iv) for recombinant production of the corresponding enzymes, which are used for production of the corresponding enzymes, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as an arkers for sequencing of the Saccharopolyspora spinosa genome. (II) are marchides with insecticidal, but not antibacterial, activity, and can also be used to raise specific antibodies, useful for identifying also be used to raise specific antibodies, useful for identifying cyprocension clones in a gene bank. Cells transformed with (I) may produce (II) at significantly increased levels or produce new derivatives of concerning the contains the coding regions for protein sinvolved in the contains the coding regions for proteins involved in the contains and contains and contains involved in the contains and contains and contains involved in the contains and contai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  24770

toggcccgaccgaggcctcggagatgtccacatccggctccaggtcggcgcgg 247 Gaps AAQ88151 encodes AAR74619 Xanthomonas campestris L-glutamyl tRNA reductase. The DNA as part of an expression vector can be used to transform a host cell, for the recombinant prodn. of the protein. The protein can be used in the prodn. of vitamin B12, glutamic acid-1-semialdehyde, 5-aminolevulinate, haem, chlorophyll and DNA fragment encoding L-glutamyl tRNA reductase - derived from Xanthomonas sp., useful for production of 5-amino:levulinate, vitamin-B12, chlorophyll, etc. ö Length 1549; Indels Sequence 1549 BP; 291 A; 516 C; 514 G; 228 T; 0 other; Score 54.4; DB 16; Pred. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparaslic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.

Sequences AAX37293-298 represent nucleic acids encoding alpha-amylase variants (AAY17904-Y179069). The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Blosci. Blotech, Blochem. Vol. 56, 76-80, 1992 ). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6119, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The

The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, Oet al, Biosci. Biotech, Biochem. Vol. 56, 76-80, 1992). The variants have a replacement of the 57th or the 130th amino acid residue in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence as compared to the wild-type. The sequences are deposited under the accession numbers FRRM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose

The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Biosci. Biochem. Vol. 56, 76-80, 1992). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose in a high yield.

Sequences AAX37293-298 represent nucleic acids encoding alpha-amylase variants (AAY17904-Y17909). The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Biosci. Biotech, Biochem. Vol. 56, 76-80, 1992 ). The variants have a replacement of the 5th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose in a high yield.
                                                                                                                                                                                           ccggacgacaagctcgtgccgctcggccaggagcacacgctgggtgacttcgacggcaa 356

Sequences AAX37293-298 represent nucleic acids encoding alpha-amylase variants (AAY17904-Y17909). The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Blosci. Biochem. Vol. 56, 76-80, 1992 ). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             761

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC ilbrary was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and bow to order individual BAC clones, the entire library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a

collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila

melanogaster genome using these BACs. For further information

please see http://www.fruitfly.org The BDGP Drosophila

melanogaster BAC library was prepared by Kazutoyo Osoegawa and

Aaron Mammoser in Pieter de Jong's laboratory in the Department of

Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,

NY. The library is named RPCI-98 and was constructed by partial

ECORI digestion of Drosophila DNA provided by the BDGP from the

isogenic strain y2; cn bw sp, the same strain used for the BDGP's

pl and EST libraries. A more detailed description of the library

and how to order individual BAC clones, the entire library, or

filters for hybridization from the BACPAC Resource Center can be

found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                       on fice as their primary source of carbohydrate.

Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 411 Mbp (Arumuqanathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55.296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila melanogaster genome survey sequence T7 end of BAC # BACK14N09 of RPCI-98 library from Drosophila melanogaster (fruit ALD), genomic survey sequence.

collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BAGs. Por further information please see http://www.fruitfy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammosst in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size distribution of 1-1.5kb fragments, blunt-ended with T4 DNA polymerase, dephosphorylated with Shrimp Alkaline
Phosphatase and ligated into pZero-2 vector's ECORV site."
